CASE STUDY · CRYPTO FUNDING CARRY

The pod said no. I tested it anyway.

Four days, eight steps, one kill that the test confirmed.

THE POD · ME

22 Oct	ECONOMIST	**The idea.** Every Sunday, short the perps where leveraged longs pay the most funding, long the cheapest. Collect the carry. Pass 1: Go.
23 Oct	DEVELOPER	**It makes money.** Train gate passes. Placebo: the real ranking (1.33) beats all 100 shuffles (95th pct 0.78).
23 Oct	RED TEAM	**But not from carry.** Price P&L after the Sunday trade: Monday +39, Tuesday +22, Wednesday to Sunday −19. A two-day price effect. Fix first.
23 Oct	ME	**Parked.** If the money is a fast effect, write the strategy around it, and test that. A new try.
25 Oct	ECONOMIST	**Rewritten.** The weekend effect becomes the mechanism. Kill criterion written before: without its 5 best names, the effect keeps a t of 1.
25 Oct	ANALYST	**Kill.** t 0.98 against a bar of 1. Five coins carried it: SOL, WLD, WAVES, PEPE, MATIC. A failed criterion kills, no "almost".
25 Oct	ME	**"Open the test anyway."** The miss was 0.02. I wanted to see.
2025 → 2026	SEALED TEST	**Net Sharpe −0.14.** Funding paid (+38%), but the price effect flipped: the long leg lost 68%. The kill stands.

It made money, for a reason we hadn't written. The pod was right before the test.
